PATENT Attorney Docket No. SALK1520-2

## In The Claims:

Please amend claims 1, 22 to 24, 50 and 53 as follows:

(Twice Amended) A method for modulating the expression of an exogenous gene in an 1. isolated cell containing:

a DNA construct comprising said exogenous gene under the control of an ecdysone response element; and

a modified ecdysone receptor which, in the presence of a ligand therefor, and optionally in the further presence of a receptor capable of acting as a silent partner therefor, binds to said ecdysone response element;

said method comprising providing to the cell an effective amount of a ligand for said modified ecdysone receptor; wherein said ligand is not normally present in the cell; and wherein said ligand is not toxio to said cell.

(Twice Amended) A method of inducing the expression of an exogenous gene in an 22. isolated cell containing:

a DNA construct comprising an exogenous gene under the control of an ecdysone (i) response element,

- DNA encoding a modified ecdysone receptor under the control of an inducible (ii) promoter; wherein said modified ecdysone receptor, in the presence of a ligand therefor, and optionally in the further presence of a receptor capable of acting as a silent partner therefor, binds to said ecdysone response element, and
- a ligand for said modified ecdysone receptor; (iii)

said method compressing subjecting said cell to conditions suitable to induce expression of said modified ecdysone receptor.
